

Career Compass — Daily 5PM

An Automated Daily Career Briefing Workflow (n8n)

Project Overview

Career Compass — Daily 5PM is an automated workflow built using n8n that delivers a personalized career briefing every day at 5:00 PM. The workflow combines live AI-industry news, career motivation tailored to the user's goals, and a daily health tip, and sends it directly to the user's email inbox without any manual effort.

Problem Statement

Working professionals, especially developers preparing for career growth, often struggle to consistently track industry trends, stay motivated toward their goals, and maintain healthy habits amid busy schedules. Relevant information is scattered across multiple sources, and there is no single, automated way to receive a concise, relevant update daily. This workflow addresses that gap by consolidating industry updates, motivation, and wellness reminders into one automated daily message.

Objectives

- Automatically deliver a daily briefing at a fixed time (5:00 PM) without manual intervention.
- Keep the user informed about current AI adoption trends across companies and industries.
- Provide targeted motivation aligned with the user's career goal (Java Developer, 12–15 LPA package range).
- Encourage healthy work habits with a daily, practical health tip.
- Deliver the briefing in a clean, readable email format.

Technology Stack

- **Automation Platform:** n8n (Cloud)
- **AI Model:** Anthropic Chat Model (via AI Agent node)
- **Data Source:** RSS feed — artificialintelligence-news.com
- **Delivery Channel:** Gmail (OAuth2 API)
- **Trigger Mechanism:** n8n Schedule Trigger node

Workflow Architecture

The workflow follows a linear, five-node pipeline. Each node passes its output to the next, transforming a raw news feed into a polished, personalized email:

Schedule Trigger → RSS Read → Limit → AI Agent → Send a Message (Gmail)

Node-by-Node Explanation

Node	Function
Schedule Trigger	Starts the workflow automatically every day at 5:00 PM (Asia/Calcutta timezone).
RSS Read	Fetches the latest articles from an AI industry news feed.
Limit	Restricts the number of articles passed forward to 3, keeping input concise.

Node	Function
AI Agent	Reads the article data and generates a structured briefing: AI industry update, career motivation, and a health tip.
Send a Message (Gmail)	Sends the generated briefing to the user's email inbox with a fixed subject line and clean formatting.

Workflow Execution

- At 5:00 PM daily, the Schedule Trigger automatically starts the workflow.
- The RSS Read node fetches the latest articles from the configured AI news feed.
- The Limit node passes only the top 3 articles forward to control input size.
- The AI Agent processes the articles and generates a three-part message covering AI industry news, motivation, and a health tip.
- The Gmail node formats and sends the final message to the user's inbox with a fixed subject line.

Benefits

- Fully automated — requires no manual action once published.
- Combines real, current information with personalized motivational content.
- Encourages consistency in both career preparation and health habits.
- Easily customizable — prompts, feeds, and timing can be adjusted at any time.

Future Enhancements

- Add a job-listing tool to surface live openings matching the target package range.
- Include a short daily DSA/coding challenge in the briefing.
- Track streaks and progress by logging briefings to a spreadsheet or database.
- Support multiple delivery channels such as Slack or WhatsApp in addition to Gmail.
- Add a feedback loop so the user can rate briefings to improve AI Agent prompts over time.

Conclusion

Career Compass — Daily 5PM demonstrates how a simple automation pipeline can turn scattered public information into a focused, personal, daily habit-building tool. By combining a scheduled trigger, a live news source, and an AI agent, the workflow delivers consistent value with zero manual effort — helping the user stay informed, motivated, and healthy on the path toward their career goal.
